Your attitudes about food influence your choices...be it for the better or worse. Examine your attitudes and try to get into the mindset that:

- All whole foods contribute nutrients that you need to perform.
- A healthy diet includes a mix of carbohydrate, protein and fat.
- There are no “bad” foods. It’s just a matter of how much and how often you eat them.
- The best diet is not a perfect diet but rather one that is balanced and realistic.

Common pitfalls for male athletes include tendency to overdo protein which cuts carbohydrate too short to support the necessary glycogen stores. To avoid this problem, consider your individual energy needs and tips for balancing your food choices:

- Current weight (lbs) x 23 = calorie needs per day for to stay the same weight
- Current weight (lbs) x 23 + 500 = calorie needs per day to gain weight
- Current weight (lbs) x 23 - (250 to 500) = calorie needs per day to lose weight

Compare your intake to the recommendations on the following pages to ensure you reach the appropriate calorie intake and balance of foods on most days. Carbohydrate, protein and fat all contribute important fuel and nutrients for your performance.

Timing of Meals and Snacks

Do not skip meals.

Eat within 1 hour of waking then continue on a routine of eating 4-6 times per day.

Eat every 3-4 hours during the day.

The closer you are to the time of your exercise, choose foods that are carbohydrate rich and lower in fat and protein.

Post event meal should include carbohydrate and protein.

Drink fluids all day. Multiply current body weight x .3 for total ounces you need each day.

Choose sports drinks with dilute carbohydrate (14g/8oz) during exercise.

Recovery Tips

Eat 200-400 calories of carbohydrate rich food within 15 minutes of finishing.

Follow with a protein/carbohydrate combination meal within 2 hours of finishing.

Replace fluid by drinking 2-3 cups fluid for every pound lost.

Carbohydrates improve your sports performance as the primary source of fuel for activity particularly high-intensity, bursts of activity and is essential for refueling muscles for future performance.

Recommendations
- Choose carbohydrate foods at all meals and snacks.
- Fill 2/3 of your plate with carbohydrate foods.
- Choose a variety of colors to ensure plenty of fruits and vegetables.
- Opt for unrefined choices over sugary carbohydrate foods.
- Avoid simple sugars or large portions too close to exercise.
- Use diluted carbohydrate (no more than 14g/8oz.) during exercise.
- Eat 200-400 calories from carbohydrate foods immediately after exercise.

Eat these carbohydrate foods for optimal sports performance:

Unrefined starches and grains
(Depending on calorie needs, eat a minimum of 8 carbohydrate selections each day. Each selection listed below provides ~ 240 calories and 50 grams of carbohydrate)
- 2-3 slices bread
- 1-1/2 hotdog, hamburger bun or English muffin
- 1 large bagel
- 1 cup rice or beans
- 1-1/2 cups pasta
- 1 large potato
- 1 cup grains
- 1-1/2 cups unsweetened cereals
- 1 cup sweetened cereals
- 1-1/2 cups oatmeal
- 3 (4-inch) pancakes
- 1-1/2 cups corn or peas
- 6 cups popcorn
- 2 cereal or granola bars
- 1/2 to 1 sports bar
- 1 low fat muffin
- 6 rice cakes

High sugar carbohydrate selections to be used for 1 or less selection per day:
- 20 jelly beans
- 8 small caramels
- 1.5 oz. chocolate
- 1 small package M&M’s
- 10 marshmallows
- 2-3 small cookies
- 1-1/2 cups frozen yogurt

Fruits
(Aim for 4-6 fruit servings per day. Selections listed below provide ~ 60 calories and 15 grams of carbohydrate)
- 1 piece whole fruit
- 1 cup cut mixed fruit
- Small handful dried fruits
- 1 cup melons and berries
- ½ cup fruit juice

Vegetables
(Aim for 4-6 vegetable servings each day. Serving sizes listed below provide ~ 25 calories)
- 1 cup raw vegetables
- ½ cup cooked vegetables
- ½ cup vegetables juice
- 2 cups raw salad greens

Limit high fat or sugary carbohydrate foods such as doughnuts, ice cream, sugary desserts, candy, chocolate, cookies, pies and sodas especially 3-4 hours prior to exercise. When choosing fries, pizza or chips, consider they also contain fat.

Protein is essential for muscle building, recovery and a healthy immune system although it is not a key fuel source during exercise. How much is enough?
- Current body weight (lbs) X .5 = minimum grams of protein per day
- Current body weight (lbs) X 1 = maximum grams of protein per day

Recommendations
- Choose lean protein foods 2-3 times per day.
- Fill ½ of your plate with lean protein foods
- Your body can use protein from all food sources.
- Protein supplements are not necessary.
- Reduce protein in meals the closer you are to an event while protein in post-game meals is essential for recovery.

Eat these protein foods for optimal recovery from exercise:

Protein Foods
(Eat a minimum of 4 protein selections each day. The selections listed below will vary in fat and calorie content but provide ~ 21 grams of protein each)
- A computer mouse size piece of chicken, turkey, beef, fish or pork
- 3 slices of lean deli meat
- 3 slices of low fat cheese
- 3 eggs
- 6 egg whites
- 1 vegetable burger
- ½ cup cottage cheese
- Burger the size of your palm
- 8 oz. tofu
- 6 Tbs. peanut butter
(“tend to be higher calorie due to high fat content)
- 3 cups skim milk

Vegetables, beans, grains and nuts also contribute to your protein intake.

Limit high fat protein foods such as fried meats, highly marbled meats, whole milk, full fat cheeses, bacon, sausage, high fat deli meats.

Fat is an important fuel source for longer duration, lower intensity activities. However, even the leanest athlete stores plenty of fat to meet this need. Daily fat requirements are based on calorie needs and satiety.

Recommendations
Choose healthy fat such as oils, nuts, nut butters and low fat condiments. Bon Appetit uses canola and olive oils in our homemade salad dressings and only canola oil is allowed in our fryers.

Eat fat to support adequate calorie intake.
(Aim for some fat at most meals but limit before exercise. Selections listed below provide ~ 100 calories and 8-10 grams of fat each)
- 1 Tbs. peanut butter
- 2 tsp. regular mayonnaise
- 2 Tbs. low fat mayonnaise
- 2 tsp. oil
- 2 pats butter or margarine
- 2 Tbs. cream cheese
- 4 Tbs. sour cream
- 1 Tbs. regular creamy salad dressings
- 2 Tbs. oil and vinegar type salad dressing
- 2 Tbs. low fat salad dressing
- 4 Tbs. nuts

When choosing high fat foods such like French fries, fried meats, a cheeseburger, a slice of pizza or creamy sauces, count them as part of the basic food group(s) AND an fat selection.
Meal Planning for Male Athletes

1. Determine your individual calorie goal:
   - Weight in pounds X 23 = daily calorie intake for weight maintenance
   - Weight in pounds X 23 + 500 = daily calorie intake for weight gain
   - Weight in pounds X 23 – (250 to 500) = daily calorie intake for weight loss

2. Consider the balance of foods you choose to meet your calorie needs.
   To achieve optimal performance, your diet should contain:
   - 60% carbohydrate
   - 15% protein
   - 25% fat

3. Use this chart in making food selections throughout the day.

   Find your weight and estimated calorie needs below to understand the balance of food groups that will help you achieve the optimal diet for sports performance. You might think with such high calorie needs that "anything goes" but to be your best, healthy food choices are still the key.

See brochure text for quick reference to selections for each food group.

*Calories needs are estimates and may vary somewhat depending on individual sport and body composition.
### Sample 3900 Calorie Day

**Breakfast**
- 1 large bagel with 2 tablespoons cream cheese
- 1-1/2 cups cereal with 2 tablespoons raisins
- 2 eggs and 1 cup skim milk

**Snack**
- 2 cereal bars

**Lunch**
- 1 cup broccoli
- 2 cups mixed salad with 2 tablespoons low fat dressing

**Dinner**
- 2 sandwiches each made with 3 slices turkey, lettuce, tomato and mustard on 2 slices whole wheat bread

**Snack**
- 1 bag low fat microwave popcorn

It is also possible to fit in higher fat favorites... or those traditional “forbidden” foods, with a bit more planning. When choosing high fat foods such like French fries, fried meats, a cheeseburger, a slice of pizza or creamy sauces, count them as part of the basic food groups AND additional fat. For example, 1 cup of French fries will count as a carbohydrate selection and a fat selection.
